(54) Title: THE USE OF ANTIBODIES TO TNF OR FRAGMENTS DERIVED THEREOF AND XANTHINE DERIVATIVES FOR COMBINATION THERAPY AND COMPOSITIONS THEREFOR

## (57) Abstract

A combined preparation for simultaneous combined, simultaneous separate, or sequential use in the therapy or prophylaxis of disorders associated with undesirably high levels of TNF, e.g. septic or endotoxic shock and immunoregulatory and inflammatory disorders, which comprises an antibody to TNF or a TNF binding fragment thereof and a xanthine derivative. Particular preferred xanthine derivatives are 3,7-dimethyl-1-(5-oxo-hexyl)xanthine (known as Pentoxifylline or Trental) and 1-(5-hydroxy-5-methylhexyl)-3-methylxanthine and similar compounds. The anti-TNF antibody or fragment is preferably monospecific especially a humanised recombinant antibody or fragment. The ratio of xanthine derivative to anti-TNF antibody component used may be in the range between 450:1 and 1:10 and doses of anti-TNF component in the range 0.001-30mg/kg/day and doses of xanthine derivative in the range 0.5 to 100mg/kg/day may be administered during treatment of human or animal subjects. It has been found that when an anti-TNF antibody and a xanthine derivative are used together in some experimental models of septic shock, a surprising combination effect is observed.

The use of antibodies to TNF or fragments derived thereof and xanthine derivatives for combination therapy and compositions therefor.

Field of the Invention

The present invention relates to a pharmaceutical product for the treatment of conditions associated with elevated 5 levels of tumour necrosis factor- $\alpha$  (herein referred to as TNF) and to the manufacture of such a product. The pharmaceutical product may, for example, be employed in the treatment of sepsis, and, in particular in the treatment of septic, or endotoxic shock.

10 Background to the Invention

TNF is a cytokine which is produced by activated macrophage and other cells and is an important regulator in inflammation and immunity. It is implicated in septic shock - an often fatal condition associated with 15 Gram-negative or Gram-positive bacteremia - as well as in other conditions such as adult respiratory distress syndrome, graft-versus-host disease and auto-immune diseases.

20 Treatments of these conditions involving the use of antibodies to TNF (anti-TNF antibodies) have been proposed and tested. For example, Beutler et al (Science (1985), 229, 869-871) showed that passive immunisation with a rabbit polyclonal antiserum against TNF protected mice from the lethal effects of Gram-negative endotoxin. 25 Similarly, antibody therapy against TNF has been shown to decrease mortality in mice undergoing graft-versus-host disease (GVHD) and to prevent splenomegaly, and cutaneous and intestinal lesions associated with acute phase GVHD. (Piguet, P.F., et al, J. Exp. Med. 1987; 166: 1280; Shalaby, M.R., et al, Transplantation 1989; 47: 1057).

- 2 -

5 In addition, patent applications of Celltech Limited disclose the use of anti-TNF antibodies in the amelioration of side effects associated with anti-lymphocyte therapy of graft-rejection (WO89/08460), and with anti-neoplastic chemotherapy (WO89/01950).

10 Certain xanthine derivatives are also known to be inhibitors of TNF. For example, EP-A-0344586 of Hoechst Aktiengesellschaft discloses xanthine derivatives effective in inhibiting the TNF whose release is induced by certain TNF-releasing substances such as amphotericin B.

The present inventors have observed that in some experimental models of septic shock a surprising combination effect is produced if an antibody to TNF and a xanthine derivative are used in combination.

15 Summary of Aspects of the Invention

20 Thus, according to a first aspect of the present invention there is provided a pharmaceutical product comprising an antibody to TNF or a TNF binding fragment thereof and a xanthine derivative as a combined preparation for simultaneous combined, simultaneous separate, or sequential use in therapy.

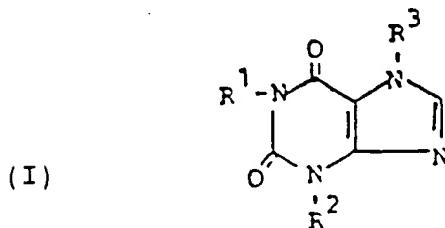

25 Such a pharmaceutical product may take the form of a pharmaceutical composition in which the antibody to TNF, or TNF binding fragment thereof and the xanthine derivative occur in admixture, optionally together with a pharmaceutically acceptable excipient, diluent, or carrier.

30 The ratio by weight of xanthine derivative to anti-TNF antibody in the composition may vary between 450: 1 and 1:10; preferably it is in the range 150:1 - 1:5 and particularly preferably between 30:1 and 1:2 for example 1:1.

- 3 -

Suitable xanthine derivatives for inclusion in the pharmaceutical product of the present invention include the following:

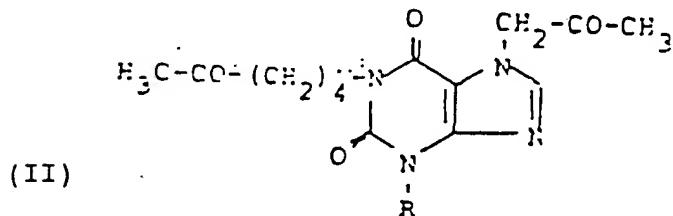

1) Compounds of the formula I

5 in which one of the radicals R<sup>1</sup> and R<sup>3</sup> represents a straight-chain alkyl, ( $\omega$ -1)-oxoalkyl or ( $\omega$ -1)-hydroxyalkyl group having 3 to 8 carbon atoms, and the two other radicals, R<sup>2</sup> and R<sup>3</sup> or R<sup>1</sup> and R<sup>2</sup>, represent straight-chain or branched alkyl groups having 1 to 8 carbon atoms in the position of R<sup>1</sup> and R<sup>3</sup> and 1 to 4 carbon atoms in the position of R<sup>2</sup>, where the total of carbon atoms in these two alkyl substituents does not exceed 10;

10

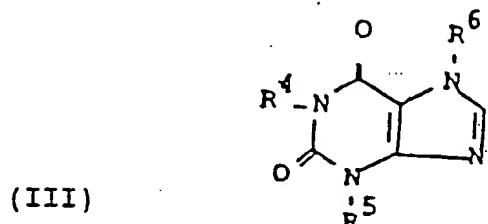

2) Compounds of the formula II

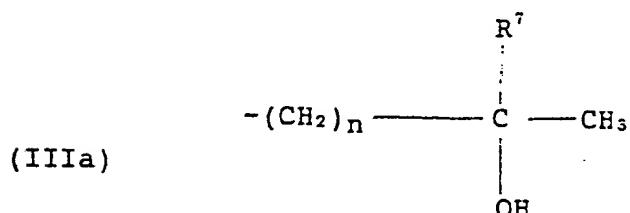

15 in which R represents an alkyl radical having 1 to 4 carbon atoms;

- 4 -

## 3) Compounds of the formula III

in which at least one of the radicals R<sup>4</sup> and R<sup>6</sup> represents a tertiary hydroxyalkyl group of the formula

where R<sup>7</sup> denotes an alkyl group having up to 3 carbon atoms, and n denotes an integer from 2 to 5, and - if only one of the radicals R<sup>4</sup> or R<sup>6</sup> denotes such a tertiary hydroxyalkyl group of the formula IIIa - the other radical represents a hydrogen atom or an aliphatic hydrocarbon radical R<sup>8</sup> which has up to 6 carbon atoms and whose carbon chain can be interrupted by up to 2 oxygen atoms or substituted by an oxo group or up to two hydroxyl groups (in which case an oxo or hydroxyl group present in the radical R<sup>8</sup> is preferably separated from the nitrogen by at least 2 carbon atoms), and R<sup>5</sup> represents an alkyl group having 1 to 4 carbon atoms;

4) Prodrug forms of the compounds of the formulae I to III, and/or

- 5 -

5) Metabolites of the compounds of the formulae I to III.

In particularly preferred embodiments the xanthine derivative is of formula I with a hexyl, 5-oxohexyl or 5-hydroxyhexyl group in the position of R<sup>1</sup> or R<sup>3</sup>. For example, 1-hexyl-3,7-dimethylxanthine, 1-(5-hydroxyhexyl)-3,7-dimethylxanthine, 3,7-dimethyl-1-(5-oxohexyl)xanthine, 7-(5-hydroxyhexyl)-1,3-dimethylxanthine, 1,3-dimethyl-7-(5-oxohexyl)xanthine, 1,3-di-n-butyl-7-(2-oxopropyl or 3-oxobutyl)xanthine, 1-(5-hydroxyhexyl)-3-methyl-7-propylxanthine and 3-methyl-1-(5-oxohexyl)-7-propylxanthine (= propentofylline), and especially 3,7-dimethyl-1-(5-oxohexyl)xanthine (= pentoxifylline) may be included in the pharmaceutical product.

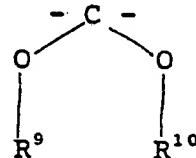

Particularly preferred compounds of the formula III for inclusion in this product are those compounds in which R<sup>5</sup> represents a methyl or ethyl group. Similarly preferred are those compounds of the formula III in which only one of the two radicals R<sup>4</sup> or R<sup>6</sup> represents the tertiary hydroxyalkyl group defined above. Additionally preferred are those compounds in which R<sup>7</sup> represents a methyl group, and n denotes an integer from 3 to 5, so that the tertiary hydroxyalkyl radical IIIa represents either [( $\omega$ -1)-hydroxy-(<math>\omega-1</math>)-methyl]-pentyl, -hexyl or heptyl, especially those in which R<sup>5</sup> denotes methyl or ethyl.

Also worth particular mention are those compounds of formula III in which R<sup>4</sup> represents the tertiary hydroxyalkyl group, and R<sup>6</sup> represents hydrogen, alkyl, hydroxyalkyl or alkoxyalkyl, having 1 to 4 carbon atoms in

- 6 -

each case, for example, 7-ethoxymethyl  
 -1-(5-hydroxy-5-methylhexyl)-3-methylxanthine,  
 7-propyl-1-(5-hydroxy-5-methylhexyl)-3-methylxanthine, or  
 1-(5-hydroxy-5-methylhexyl)-3-methylxanthine.

5 As mentioned above some embodiments of the pharmaceutical product of the present invention may comprise the oxoalkylxanthines of the formula I and II, or the hydroxyalkylxanthines of the formula I and III, not as such but in the form of a prodrug from which the  
 10 therapeutically active xanthine compounds, having the substituents defined in formulae I, II and III, can be released only by biotransformation in the body. Suitable derivatives include the acetalized oxoalkylxanthines in  
 15 which the carbonyl groups are replaced by the structural element of formula IV

(IV)

and the O-acylated hydroxyalkylxanthines having the structural element of the formula (V)

20 in place of the hydroxyl group, where R⁹ and R¹⁰ each represents an alkyl group having up to 4 carbon atoms or together represents an ethylene, trimethylene or tetramethylene group, and R¹¹ denotes an alkyl radical having up to 4 carbon atoms or optionally substituted phenyl or pyridyl.

- 7 -

In particular the preferred xanthine derivatives for inclusion in the pharmaceutical product of the present invention are pentoxifylline (3,7-dimethyl-1-(5-oxohexyl)xanthine), also known as 5 Trental, and 1-(5-hydroxy-5-methylhexyl)-3-methyl xanthine which is referred to hereafter as HWA 138.

The anti-TNF antibody or TNF binding fragment thereof included in the pharmaceutical product of the present invention is preferably a TNF neutralising antibody or 10 antibody fragment. By neutralisation is intended the reduction in, or inhibition of a biological activity of TNF as measured by an in vitro or in vivo test.

The anti-TNF antibody or fragment included in the pharmaceutical product of the present invention may in 15 general belong to any immunoglobulin class. Thus for example the anti-TNF antibody may be an immunoglobulin G or immunoglobulin M antibody.

The anti-TNF antibody may be of animal, for example mammalian origin and may be for example of murine, rat or 20 human origin. The antibody may be a whole immunoglobulin, or a fragment thereof, for example a fragment derived by proteolytic cleavage of a whole antibody, such as  $F(ab')_2$ , Fab' or Fab fragments, or fragments obtained by recombinant DNA techniques, for 25 example Fv fragments (as described in International Patent Application No. WO89/02465).

The anti-TNF antibody may be polyspecific but is 30 preferably monospecific for human TNF. The antibodies may be polyclonal or monoclonal antibodies. Particularly useful antibodies for us according to the invention include recombinant anti-TNF antibodies and fragments thereof, i.e. anti-TNF antibodies or fragments which have been produced using recombinant DNA techniques.

Especially useful recombinant antibodies include, (1) those having an antigen binding site at least part of which is derived from a different antibody, for example those in which hypervariable or complementarity 5 determining regions of one antibody have been grafted into variable framework regions of a second, different, and preferably human, antibody (as described in European Patent Application EP-A-239400); (2) recombinant antibodies or fragments wherein non-Fv sequences have been 10 substituted by non-Fv sequences from other, different antibodies (as described in European Patent Applications EP-A-171496, EP-A-173494 and EP-A-194276); or (3) recombinant antibodies or fragments possessing 15 substantially the structure of a natural immunoglobulin but wherein the hinge region has a different number of cysteine residues from that found in the natural immunoglobulin, or wherein one or more cysteine residues in a surface pocket of the recombinant antibody or fragment is in the place of another amino acid residue present in 20 the natural immunoglobulin (as described in International Patent Applications Nos. WO89/01974 and WO89/01782 respectively).

The anti-TNF antibodies may be prepared using well-known 25 immunological techniques employing TNF as antigen. Thus, for example, any suitable host may be injected with TNF and the serum collected to yield the desired polyclonal anti-TNF antibody after appropriate purification and/or concentration, (for example by affinity chromatography using immobilised TNF as the affinity medium). 30 Alternatively, splenocytes or lymphocytes may be recovered from the TNF-injected host and immortalised using for example the method of Kohler *et al*, Eur. J. Immunol. 6, 511, (1976), the resulting cells being diluted and cloned to obtain a monoclonal line producing anti-TNF antibodies 35 in accordance with conventional practice. Antibody

- 9 -

fragments may be produced using conventional techniques, for example by enzymatic digestion of whole antibodies e.g. with pepsin [Parham, J. Immunol., 131, 2895, (1983)] or papain [Lamoyi and Nisonoff, J. Immunol. Meth., 56, 5 235, (1983)].

Where it is desired to produce recombinant anti-TNF $\alpha$  antibodies these may be produced using, for example, the general methods described in the above-mentioned patent specifications.

10 According to a second aspect of the invention there is provided the use of an antibody to TNF and of a xanthine derivative in the manufacture of a pharmaceutical product of the first aspect of the invention.

15 For example, an antibody to TNF and a xanthine derivative as described above may be mixed together and a pharmaceutically acceptable excipient, diluent, or carrier may optionally also be mixed in.

20 The pharmaceutical product may be utilised in any therapy where it is desired to reduce the level of TNF present in the human or animal body. The TNF may be in circulation in the body or present in an undesirably high level localised at a particular site in the body.

25 For example, elevated levels of TNF are implicated in immunoregulatory and inflammatory disorders and in septic, or endotoxic, and cardiovascular shock. The pharmaceutical product according to the first aspect of the present invention may be utilised in therapy of conditions which include sepsis, septic or endotoxic shock, cachexia, adult respiratory distress syndrome, 30 AIDS, allergies, psoriasis, T.B., inflammatory bone disorders, blood coagulation disorders, burns, rejection

- 10 -

episodes following organ or tissue transplant and autoimmune disease e.g. organ specific disease such as thyroiditis or non-specific organ diseases such as rheumatoid and osteo-arthritis.

5        Additionally, the pharmaceutical product may be used to ameliorate side effects associated with TNF generation during neoplastic therapy and also to eliminate or ameliorate shock related symptoms associated with the treatment or prevention of graft rejection by use of an 10      antilymphocyte antibody, or may be used for treating multi-organ failure (MOF).

The pharmaceutical product according to the first aspect of the invention is preferably for treatment of sepsis, or septic/endotoxic shock.

15      The pharmaceutical product according to the first aspect of the invention may be for administration in any appropriate form and amount according to the therapy in which it is employed. It may be for prophylactic use, for example where circumstances are such that an elevation 20      in the level of TNF might be expected or alternatively, the product may be for use in reducing the level of TNF after it has reached an undesirably high level or as the level is rising.

25      The pharmaceutical product may take any suitable form for administration, and, in particular, will be in a form suitable for parenteral administration e.g. by injection or infusion, for example by bolus injection or continuous infusion. Where the product is for injection or infusion it may take the form of a suspension, solution or emulsion of all or each of the components in an oily or aqueous vehicle and it may contain formulatory agents such as suspending, stabilising and/or dispersing agents.

- 11 -

Alternatively, the product may be in dry form, for reconstitution before use with an appropriate sterile liquid.

5 Where the anti-TNF and xanthine derivative components of the pharmaceutical product are for separate administration each may be formulated according to conventional practice and the formulation of each component may contain one or more other active ingredients.

10 In particular, while the anti-TNF antibody is likely to be unsuitable for oral administration such a limitation may not apply to the xanthine derivative.

15 When the xanthine derivative is for oral administration the formulation may contain, in addition, to the active ingredient, additives such as; starch - e.g. potato, maize or wheat starch or cellulose - or starch derivatives such as microcrystalline cellulose; silica; various sugars such as lactose; magnesium carbonate and/or calcium phosphate. It is desirable that, if the formulation is for oral administration it will be well tolerated by the patient's digestive system. To this end it may be desirable to 20 include in the formulation mucus formers and resins. It may also be desirable to improve tolerance by formulating the xanthine derivative in a capsule which is insoluble in the gastric juices. It may also be preferable to include 25 the xanthine derivative in a controlled release formulation.

30 In a still further aspect of the invention there is provided a method of treatment of a human or animal subject suffering from or at risk of a disorder associated with an undesirably high level of TNF, the method comprising administering to the subject an effective amount of the pharmaceutical product according to the

- 12 -

first aspect of the invention. In particular the human or animal subject may be suffering from, or at risk from, sepsis, or septic or endotoxic shock.

5 The dose at which each pharmaceutical product will be administered will depend on the nature of the condition to be treated, the degree to which the TNF to be neutralised is, or is expected to be, raised above a desirable level, and on whether the product is being used prophylactically or to treat an existing condition. The dose will also be  
10 selected according to the age and condition of the patient.

Thus, for example, where the product is for treatment or prophylaxis of septic shock suitable doses of antibody to TNF lie in the range 0.001-30mg/kg/day, preferably 0.01-10mg/kg/day and particularly preferably  
15 0.1-2mg/kg/day while suitable doses of xanthine derivative lie in the range 0.5 to 100mg/kg/day, preferably in the range from 0.5 to 50mg/kg/day, and particularly preferably from 1 to 30mg/kg/day. In general, the dose may be continued for as long as is necessary to alleviate the  
20 condition associated with the undesirably high level of TNF. In particular, it may be desirable to administer the dose of the xanthine derivative continuously by infusion or to repeat the dose of the xanthine derivative at regular, intervals for example of 2 to 24 hours, preferably 6 to 12 hours even if no repeat dose of  
25 anti-TNF antibody is administered.

Brief Description of the Drawings

30 Embodiments of the invention are described below by way of example and with reference to the accompanying drawings of which:

- 13 -

Fig 1 shows a plot of mean deaths per experiment against time in an E.coli LPS induced shock model in which pentoxifylline or the hamster anti-mouse TNF antibody TN3 19.12 were administered to subjects of the experiment at various doses:

5

30

- 14 -

5

Fig 5 shows a similar block diagram in which inhibition of mortality in a salmonella abortus equi LPS induced shock model is plotted for an experiment in which various amounts of TN3 19.12 and/or the xanthine derivative pentoxifylline were administered to galactosamine sensitised and LPS challenged mice.

10

In the examples which follow bacterial LPS (lipopolysaccharide) was used to induce septic shock in mice.

- 15 -

Description of Embodiments of the Invention

Example 1

5 In a first experiment outbred mice were divided into groups and received treatment either with a hamster anti-murine TNF antibody TN3 19.12 or with the xanthine derivative, pentoxifylline.

Each group of animals received 60mg/kg E.coli LPS by intravenous injection into a tail vein. This dose of LPS corresponds to the LD90 in mice.

10 Those groups of animals treated with TN3 19.12 received between 0.1 and 30mg/kg of the antibody by intravenous injection of 0.1ml of liquid into the tail vein 2 hours before LPS administration.

15 Those groups to be treated with pentoxifylline received between 1mg/kg and 300mg/kg intravenously five minutes prior to LPS administration.

In control experiments animals received an injection of an equivalent volume of saline.

20 The results of these experiments are shown in Fig 1. TN3 19.12 alone produced a protective effect at doses  $\geq$  1mg/kg. By contrast, pentoxifylline alone had no effect at doses of 1mg/kg and at higher concentrations it accelerated mortality.

25 In a second experiment both TN3 19.12 and pentoxifylline were administered at a dose of 1mg/kg, the TN3 antibody being administered 2 hrs prior to LPS and the pentoxifylline 5 mins prior to LPS administration as before. The results are shown in Fig 2 and demonstrate that mice receiving the combined treatment were protected

- 16 -

against LPS induced death for 24 hrs after LPS administration. Subsequently, however, mortality rose to levels comparable with the control or pentoxifylline only groups.

5 It was believed that this effect may be due to the shorter half life of pentoxifylline relative to TN3 and might be compensated for by repeating pentoxifylline administration throughout the treatment period, for example, every 12 or 24 hours.

10 In order to confirm this hypothesis a further experiment was carried out with groups of twenty mice. The groups received one of three different treatment as follows:

- A) Control - received 60mg/kg E.coli LPS intravenously followed by saline injection;
- 15 B) Received 1mg/kg TN3 19.12 i.v. 2 hrs prior to challenge with 60mg/kg E.coli LPS i.v. and 1mg/kg pentoxifylline i.v. 5 mins prior to challenge;
- C) As B) but these mice also received repeat doses of 1mg/kg pentoxifylline 24,48 and 72 hours after LPS challenge.

20 The results of this experiment are shown in Fig 3. As in previous experiments group B) showed enhanced survival relative to the control at 24 hrs from LPS challenge but at later observation times survival was not significantly different from the control. By contrast the survival in group C) was markedly better than the control with 17 out of 20 animals surviving at 72 hrs from LPS challenge.

- 17 -

Example 2

Similar experiments to those described above were carried out in galactosamine sensitised C57BL mice which were challenged with LPS from *Salmonella abortus equi*.

5 Mortality was measured 96 hrs after the LPS challenge.

Low doses of TN3 of between 0.1 and 0.25mg/kg administered intravenously 1hr prior to administration of 0.2 $\mu$ g LPS and 10mg galactosamine per mouse had no protective effect.

10 By contrast the xanthine derivative HWA 138 at a dose of 30mg/kg intraperitoneally had a partially protective effect (c.20% inhibition of mortality).

15 Coadministration of TN3 at doses  $\geq$  0.2mg/kg together with 30mg/kg HWA 138 significantly reduced mortality relative to 30mg/kg HWA 138 used alone. These results are shown in Fig 4.

20 This experiment was repeated using pentoxyfylline in place of HWA 138 and similar results were obtained as shown in Fig 5. In this case 100mg/kg of pentoxyfylline either alone or in combination with low doses of TN3 (0.10 or 0.15 mg/kg) had no protective effect. However, mortality could be completely inhibited by combined administered of 100mg/kg pentoxyfylline and 0.25 mg/kg of TN3.

CLAIMS

1. A pharmaceutical product comprising an antibody to TNF or a TNF binding fragment thereof and a xanthine derivative as a combined preparation for simultaneous combined, simultaneous separate or sequential use in therapy.

5

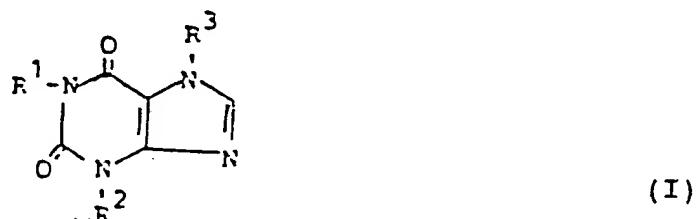

2. A pharmaceutical product according to Claim 1 in the form of a pharmaceutical composition comprising in admixture the antibody to TNF, or TNF binding fragment thereof and the xanthine derivative.

10

3. A pharmaceutical product according to Claim 2, in which the ratio of xanthine derivative to anti-TNF antibody component is in the range between 450:1 and 1:10.

15

4. A pharmaceutical product according to any one of Claims 1-3, in which the xanthine derivative is a compound of formula I.

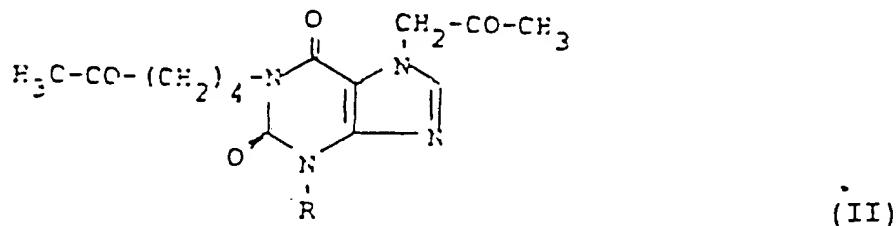

20 in which one of the radicals R<sup>1</sup> and R<sup>3</sup> represents a straight-chain alkyl, ( $\omega$ -1)-oxoalkyl or ( $\omega$ -1)-hydroxyalkyl group having 3 to 8 carbon atoms, and the two other radicals, R<sup>2</sup> and R<sup>3</sup> or R<sup>1</sup> and R<sup>2</sup>, represent straight-chain or branched alkyl groups

- 19 -

having 1 to 8 carbon atoms in the position of R<sup>1</sup> and R<sup>3</sup> and 1 to 4 carbon atoms in the position of R<sup>2</sup>, where the total of carbon atoms in these two alkyl substituents does not exceed 10.

5. 5. A pharmaceutical product according to any one of Claims 1-3, in which the xanthine derivative is a compound of formula II

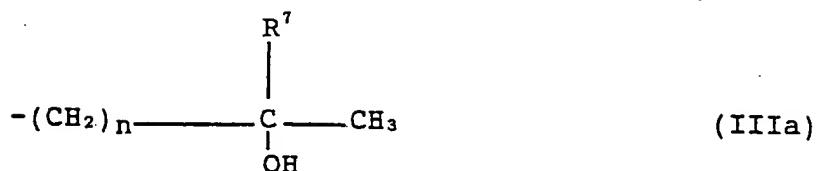

in which R represents an alkyl radical having 1 to 4 carbon atoms.

10. 6. A pharmaceutical product according to any one of Claims 1-3, in which the xanthine derivative is a compound of formula III

15. in which at least one of the radicals R<sup>4</sup> and R<sup>6</sup> represents a tertiary hydroxyalkyl group of the formula IIIa.

- 20 -

where  $\text{R}^7$  denotes an alkyl group having up to 3 carbon atoms, and  $n$  denotes an integer from 2 to 5, and - if only one of the radicals  $\text{R}^4$  or  $\text{R}^6$  denotes such a tertiary hydroxyalkyl group of the formula IIIa - the other radical represents a hydrogen atom or an aliphatic hydrocarbon radical  $\text{R}^8$  which has up to 6 carbon atoms and whose carbon chain can be interrupted by up to 2 oxygen atoms or substituted by an oxo group or up to two hydroxyl groups (in which case an oxo or hydroxyl group present in the radical  $\text{R}^8$  is preferably separated from the nitrogen by at least 2 carbon atoms), and  $\text{R}^5$  represents an alkyl group having 1 to 4 carbon atoms;

5

10

15

20

25

7. A pharmaceutical product according to any one of Claims 4, 5 or 6, in which the xanthine derivative is in the form of a prodrug or metabolite of the compound of formula I, II or III.

8. A pharmaceutical product according to Claim 4, in which the xanthine derivative comprises:

1-hexyl-3,7-dimethylxanthine,  
 1-(5-hydroxyhexyl)-3,7-dimethylxanthine,  
 3,7-dimethyl-1-(5-oxohexyl)xanthine,  
 7-(5-hydroxyhexyl)-1,3-dimethylxanthine,  
 1,3-dimethyl-7-(5-oxohexyl)xanthine,  
 1,3-di-n-butyl-7-(2-oxopropyl)xanthine,  
 1,3-di-n-butyl-7-(3-oxybutyl)xanthine,  
 1-(5-hydroxyhexyl)-3-methyl-7-propylxanthine,  
 3-methyl-1-(5-oxohexyl)-7-propylxanthine or  
 3,7-dimethyl-1-(5-oxohexyl)xanthine

- 21 -

9. A pharmaceutical product according to Claim 6, in which the xanthine derivative comprises:  
7-ethoxymethyl -1-(5-hydroxy-5-methylhexyl)  
-3-methylxanthine, 7-propyl-1-  
5 (5-hydroxy-5-methylhexyl)-3-methylxanthine, or  
1-(5-hydroxy-5-methylhexyl)-3-methylxanthine.
10. A pharmaceutical product according to any one of the preceding claims, in which the anti-TNF antibody or TNF binding fragment thereof is a TNF neutralising antibody or antibody fragment.
11. A pharmaceutical product according to any one of the preceding claims in which the anti-TNF antibody or antibody fragment is monospecific.
12. A pharmaceutical product according to any one of the preceding claims, in which the anti-TNF antibody or antibody fragment is a recombinant antibody or antibody fragment.
13. A pharmaceutical product according to Claim 12, in which the anti-TNF antibody or antibody fragment is a humanised recombinant antibody or antibody fragment.
14. A pharmaceutical product according to any one of the preceding claims for use in the amelioration of side effects associated with TNF generation during neoplastic therapy.
- 25 15. A pharmaceutical product according to any one of claims 1-13 for use in the elimination or amelioration of shock related symptoms associated with antilymphocyte therapy.

- 22 -

16. A pharmaceutical product according to any one of claims 1-13 for use in the treatment of multi-organ failure.
- 5 17. A pharmaceutical product according to any one of claims 1-13 for use in the treatment of sepsis or septic/endotoxic shock.
- 10 18. The use of an antibody to TNF or fragment thereof and of a xanthine derivative in the manufacture of a pharmaceutical product for use as a combined preparation for simultaneous combined, simultaneous separate or sequential use in therapy.
- 15 19. A process for the preparation of a pharmaceutical product according to Claim 2 comprising admixing effective amounts of an anti-TNF antibody or fragment thereof and a xanthine derivative.
- 20 20. A process according to Claim 19, in which the antibody or fragment thereof and the xanthine derivative are admixed also with a pharmaceutically acceptable excipient, diluent or carrier.
- 20 21. A method of treatment of a human or animal subject, suffering from or at risk of a disorder associated with an undesirably high level of TNF, comprising administering to the subject an effective amount of a pharmaceutical product according to Claim 1.
- 25 22. A method according to Claim 21 comprising administering doses of anti-TNF antibody or antibody fragment in the range 0.001-30mg/kg/day and doses of xanthine derivative in the range 0.5 to 100mg/kg/day.

## INTERNATIONAL SEARCH REPORT

International Application No PCT/GB 91/01907

**I. CLASSIFICATION OF SUBJECT MATTER** (If several classification symbols apply, indicate all)<sup>b</sup>

According to International Patent Classification (IPC) or to both National Classification and IPC

According to International Patent Classification (IPC), the U.S. National Classification (USPC) and the European Patent Classification (EPC).

## II. FIELDS SEARCHED

**Minimum Documentation Searched?**

Classification System	Classification Symbols
Int.C1.5	A 61 K

**Documentation Searched other than Minimum Documentation  
to the Extent that such Documents are Included in the Fields Searched<sup>8</sup>**

### III. DOCUMENTS CONSIDERED TO BE RELEVANT<sup>9</sup>

Category <sup>a</sup>	Citation of Document, <sup>11</sup> with indication, where appropriate, of the relevant passages <sup>12</sup>	Relevant to Claim No. <sup>13</sup>
A, P	Clinics in Chest Medicine, vol. 11, no. 4, December 1990, W.B. Saunders Co., Harcourt Brace Jovanovich, Inc.; G. Goldstein et al.: "Pharmacologic treatment of the adult respiratory distress syndrome", pages 773-787, see pages 783,784: summary ---	1-21
A	American Review of Respiratory Disease, vol. 137, no. 4, part 2, suppl. April 1988, Am. Lung Ass. New York (US), C.M. Lilly et al.: "Pentoxifylline prevents hypotension and pulmonary injury caused by tumor necrosis factor", page 138, see the whole abstract ---	1-21

° Special categories of cited documents : <sup>10</sup>

**"A"** document defining the general state of the art which is not considered to be of particular relevance

**"E"** earlier document but published on or after the international filing date

1 document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

**"O"** document referring to an oral disclosure, use, exhibition or other means

**P** document published prior to the international filing date but later than the priority date claimed

**\*T\*** later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

**"X"** document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step

**"Y"** document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the

document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

& document member of the same patent family

#### IV. CERTIFICATION

Date of the Actual Completion of the International Search  29-01-1992	Date of Mailing of this International Search Report  17. 02. 92
International Searching Authority  EUROPEAN PATENT OFFICE	Signature of Authorized Officer   Anni Mortensen miss. MORTENSEN

III. DOCUMENTS CONSIDERED TO BE RELEVANT (CONTINUED FROM THE SECOND SHEET)		
Category <sup>a</sup>	Citation of Document, with indication, where appropriate, of the relevant passages	Relevant to Claim No.

## FURTHER INFORMATION CONTINUED FROM THE SECOND SHEET

V.  OBSERVATION WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE <sup>1</sup>

This International search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claim numbers 22 because they relate to subject matter not required to be searched by this Authority, namely:

See PCT Rule 39.1(iv).

Remark: Although claim 21 is directed to a method of treatment of (diagnostic method practised on) the human/animal body the search has been carried out and based on the alleged effects of the compound/composition.

2.  Claim numbers because they relate to parts of the International application that do not comply with the prescribed requirements to such an extent that no meaningful International search can be carried out, specifically:

3.  Claim numbers because they are dependent claims and are not drafted in accordance with the second and third sentences of PCT Rule 6.4(a).

VI.  OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING <sup>2</sup>

This International Searching Authority found multiple Inventions in this International application as follows:

1.  As all required additional search fees were timely paid by the applicant, this International search report covers all searchable claims of the International application
2.  As only some of the required additional search fees were timely paid by the applicant, this International search report covers only those claims of the International application for which fees were paid, specifically claims:
3.  No required additional search fees were timely paid by the applicant. Consequently, this International search report is restricted to the invention first mentioned in the claims; it is covered by claim numbers:
4.  As all searchable claims could be searched without effort justifying an additional fee, the International Searching Authority did not invite payment of any additional fee.

## Remark on Protest

The additional search fees were accompanied by applicant's protest:  
 No protest accompanied the payment of additional search fees.
